

MOON

THE ART OF TECHNOLOGY

FOR IMMEDIATE RELEASE - June 28, 2002

Simaudio Ltd. proudly announces the introduction of the **MOON i-3 Integrated Amplifier**, our newest addition to the **MOON Audio Reference series** of audio components. Based on the well established MOON i-5 Integrated Amplifier, the **i-3** delivers "audiophile" performance in a more affordable package. Over two decades of experience in the design and manufacturing of amplifiers, preamplifiers and integrated amplifiers have paved the way for the **MOON i-3**.

Significant Design Features:

- Simaudio's "Advanced Renaissance" technology which eliminates feedback, resulting in real-time amplification, more tonally accurate musical reproduction, virtually non-existent transient intermodulation distortion and the elimination of phase errors.
- An oversized power supply using a custom proprietary toroidal transformer design.
- Extremely short capacitor-free signal path measuring 18.5 inches in length, from input RCA connectors to output binding posts, yielding a faster transient response.
- A gain section that uses a Crystal microprocessor functioning as a "shunt-to-ground" that doesn't degrade sonic performance regardless of the output level.
- Rated output of 100 watts/channel into 8 ohms and 160 watts/channel into 4 ohms.
- One input which functions as a "pass-through" that bypasses the gain stage to accommodate a component such as a home-theater processor, whose own volume control is used instead.
- Remote control operation.
- J-FET input devices in the preamplifier section.
- Precision-matched Bipolar output devices in the amplification section.
- Class A output to 5 watts for greater efficiency.
- Heavy-duty gold-plated output binding posts.
- Pure copper circuit board tracings with low impedance characteristics.
- Accurate matching of the finest high quality electronic components.
- Low operating temperature for a longer than normal life expectancy.
